

Profile® Hydraulic Solutions Better Than Blankets. Better For The Environment.

Profile® hydraulically applied erosion control products like Flexterra® High Performance-Flexible Growth Medium® (HP-FGM®) and ProMatrix™ Engineered Fiber Matrix™ (EFM™) not only perform better than Erosion Control Blankets (ECBs)—they're also better for the planet.

Incredible Results Without the Liability

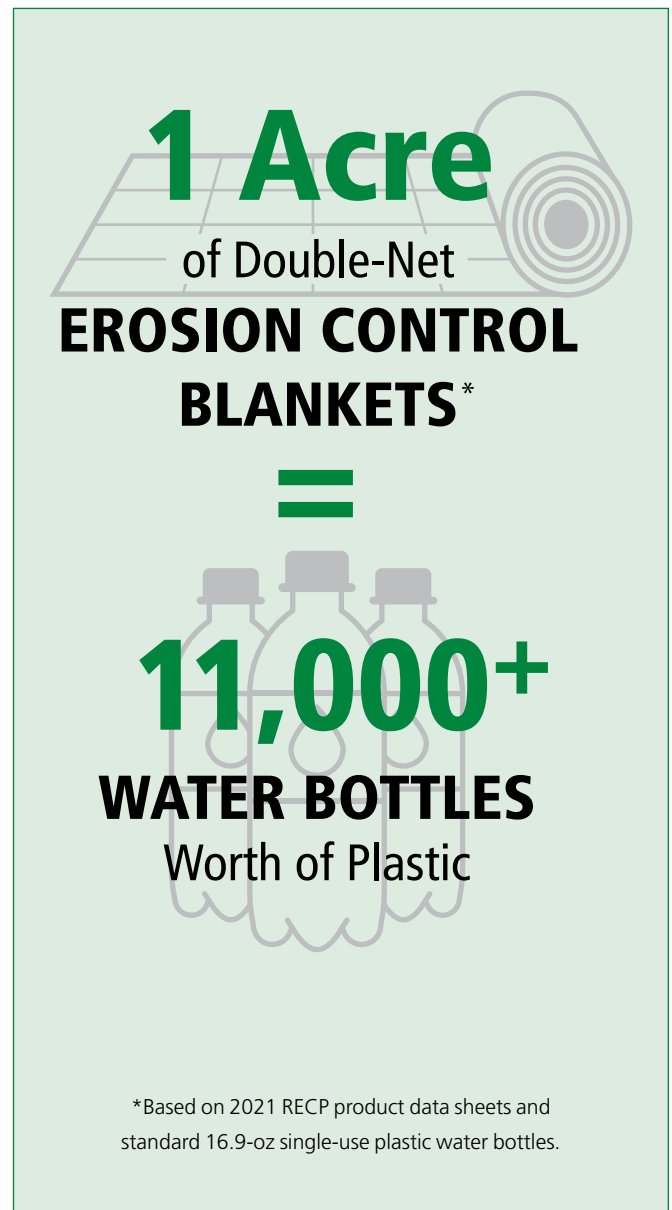

If your goal is to create sustainable vegetation to enhance the natural environment, why introduce hazards in the form of plastic and metal pollutants?

Utilize Profile's environmentally friendly products and you'll get exceptional erosion control without leaving behind contaminants.

- Prevent over 11,000 water bottles-worth of plastic and microplastics from entering the environment per one-acre site* when compared to double-net blankets.
- Flexterra and ProMatrix are 100% biodegradable and non-toxic. Both Flexterra and ProMatrix are Certified Biobased Products through the U.S. Department of Agriculture (USDA) BioPreferred® Program.
- Get faster vegetative establishment and greater biomass production.

An acre of blankets contains up to 263 pounds (119 kg) of plastic netting that can entrap terrestrial and aquatic wildlife, as well as hundreds of metal staples that create projectile hazards to maintenance personnel.

Save Time and Money When You Make the Switch

The benefits of Profile® technologies go beyond the environmental. Flexterra HP-FGM and ProMatrix EFM are also more efficient and cost effective.

Save Time

Time is money. Applying one acre of double-netted blankets can require up to 36 additional man-hours for installation.

Save Money

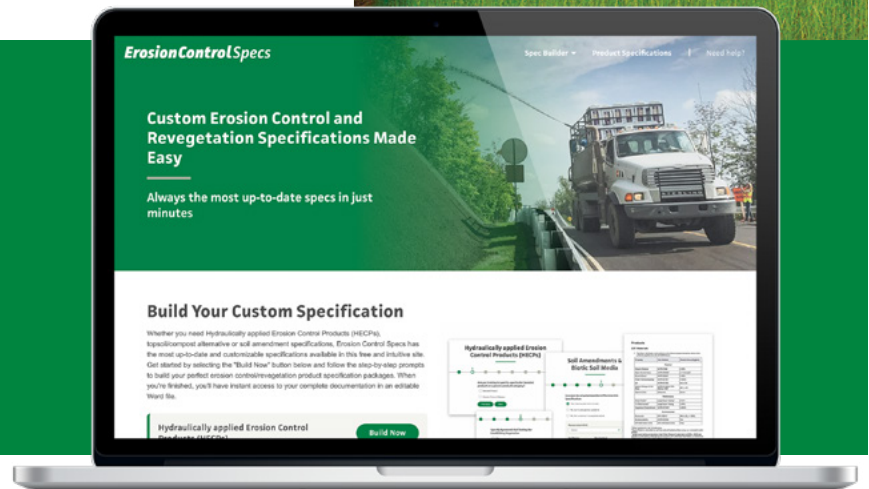

Switch to Flexterra or ProMatrix and you'll also save time and labor with a single-step application process. Avoid additional steps required by blankets for smooth grading, site preparation, plus seed and fertilizer applications.

Make the Switch Today

It's time to evolve your approach to environmental best practices toward erosion control and vegetative establishment.
