

PIA
PRECISION IMAGE ANALYSIS

CLOUD-BASED BENEFITS

Medical image post-processing through a cloud-based service provides significant advantages over maintaining an inhouse imaging lab. These advantages positively impact multiple departments and organizational levels. Benefits include:

Access to multiple imaging software platforms—without licensing or infrastructure expenditures

Easily customizable protocols for analysis and reporting per study type

Images and reports accessible for remote viewing and editing via any internet connected device

Multiple imaging software options available, to fit physician requirements

Scale cloud-based services up or down to match workflow requirements

CLOUD-BASED ADVANCED MEDICAL IMAGE POST-PROCESSING

Using an outsourced image post-processing solution doesn't have to mean giving up control of the results

PERSONALIZED INTERACTIONS

Each PIA client is assigned a lead technologist responsible for ensuring client-specific customization and protocols are implemented and adhered to for each imaging study. If physicians have questions or require assistance with custom modifications or measurements, technologists are available in real-time, for immediate consultation.

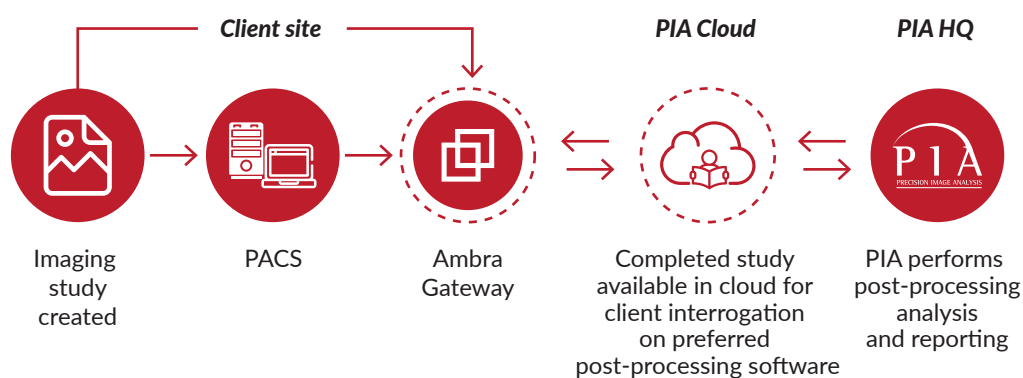

RESPONSIVE SERVICE

Cloud-based remote access to imaging cases is as easy as pressing the send and awaiting the return of quantitative data and analysis. But some cases are not that simple. When modifications, explanations, or additional measurements are required, communication with an actual live technologist is essential. Our technologists are available for live consultation or joint tele-support session. And they accept instructions or study notes via email, text or telephone—no FAX required.

EDITABLE ANALYSIS

Our post-processing image analysis is not complete until our clients are satisfied. We understand that behind each study is a patient, and patient care is top priority. If custom measurements are needed or modifications to an analysis are required, our cloud-based system enables clients to make these edits either on their own or in joint session with PIA technologists.
